

# Refactoring Review

---

Name these refactorings

?

## BEFORE

```
def normalize(text):  
    """Remove space & _"""  
    text = text.trim()  
    text = text.replace('_',  
                        ' ')  
    return text
```

## AFTER

```
def normalize(text):  
    """Remove space & _"""  
    result = text.trim()  
    result =  
        result.replace('_', ' ')  
    return result
```

## (two names for this refactoring)

### BEFORE

```
def roots(a, b, c):  
    """Roots of Quadratic"""  
    if b*b - 4*a*c >= 0:  
        x1 = (-b +  
              sqrt(b*b-4*a*c))/(2*a)  
        x2 = (-b -  
              sqrt(b*b-4*a*c))/(2*a)  
        return (x1, x2)  
  
    else:  
        return None
```

### AFTER

```
def roots(a, b, c):  
    """Roots of Quadratic"""  
    descrim = b * b - 4 * a * c  
    if descrim >= 0:  
        descrim = sqrt(descrim)  
        x1 = (-b + descrim)/(2*a)  
        x2 = (-b - descrim)/(2*a)  
        return (x1, x2)  
  
    # else is not needed  
    return None
```

## BEFORE

```
def find(text: str):  
    """Find text in file"""  
    found = False  
    line = None  
    file = open("somefile")  
    while not found:  
        line = file.readline()  
        if text in line:  
            found = True  
    file.close()  
    return line
```

## AFTER

```

    """Find text in file"""  
    with open("somefile")  
        as file:  
        for line in file:  
            if text in line:  
                return line  
  
    return None
```

?

## BEFORE

```
for rental in rentals:  
    title = (  
        rental.get_movie()  
        .get_title()  
    )
```

## AFTER

```
for rental in rentals:  
    title =  
        rental.get_title()
```

?

## BEFORE

```
person[0] = 'Bill'
person[1] = 'Gates'
person[2] = 'bill@msft.com'

print_person(person)

def print_person(person):
    print(f"{person[0]}
           {person[1]}
           email <{person[2]}>")
```

## AFTER

```
class Person:
    def __init__(self,
                  first, last, email):
        self.first = first
person = Person("Bill", ...)
print_person(person)

def print_person(person):
    print(f"{person.first}
           {person.last}
           email <{person.email}>")
```

?

## BEFORE

```
def print_person(firstname,
                 lastname,
                 email):
    print(f"{firstname}
          {lastname}
          email <email>")
```

# invoke using:

```
p = Person("Bill", "Gates"..
print_person(p.firstname,
            p.lastname, p.email)
```

## AFTER

```
def print_person(person):
    print(f"{person.first}
          {person.last}
          email <{person.email}>")
```

# invoke using:

```
p = Person("Bill", "Gates"..
print_person( p )
```

?

## BEFORE

```
class Person:
    def __init__(self,
        first, last, email):
        self.first = first

def print_person(person):
    print(f"{person.first}
           {person.last}
           email <{person.email}>")

person = Person("Bill", ...)
print_person(person)
```

## AFTER

```
class Person:

                {self.last} email ..."

person = Person("Bill", ...)
print(person)
```

what is the *justification* (reason) for this change?

?

## BEFORE

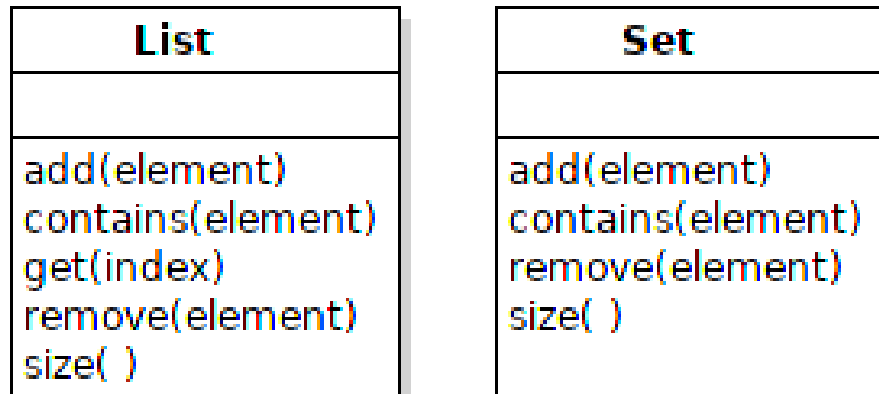

```
def greet(firstname):  
    if datetime.now().hour  
        < 12:  
        print("Good morning",  
              firstname)  
    else:  
        print("G'd afternoon",  
              firstname)
```

## AFTER

```
def greet(firstname):  
    if is_morning():  
        print("Good morning",  
              firstname)  
    else:  
        print("G'd afternoon",  
              firstname)  
  
def is_morning():  
    return \  
        datetime.now().hour < 12
```

?

## BEFORE

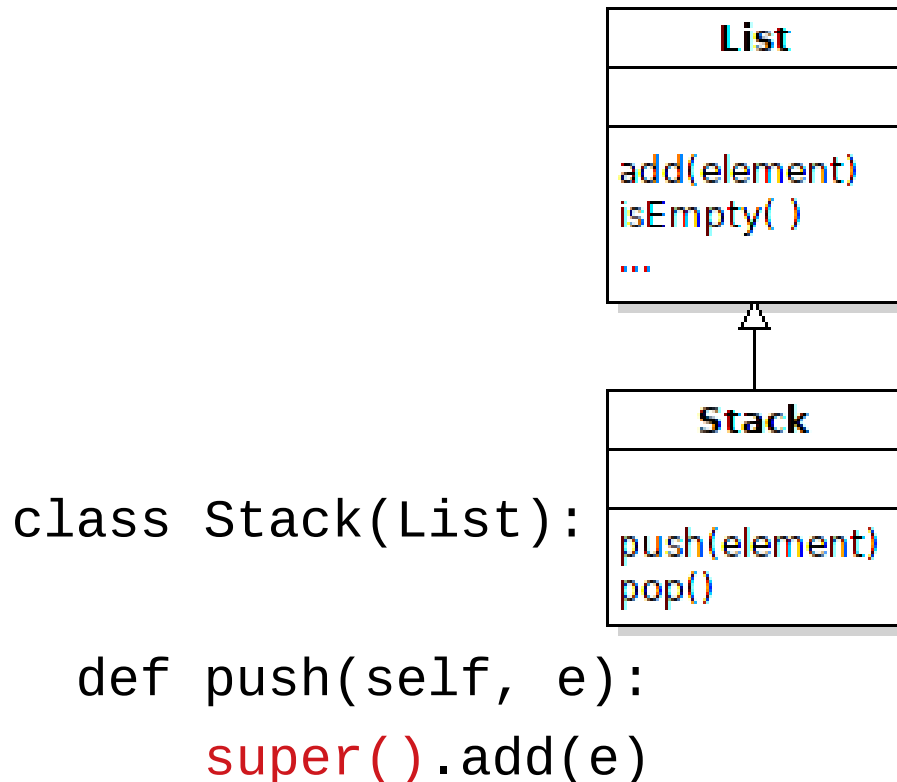

## AFTER

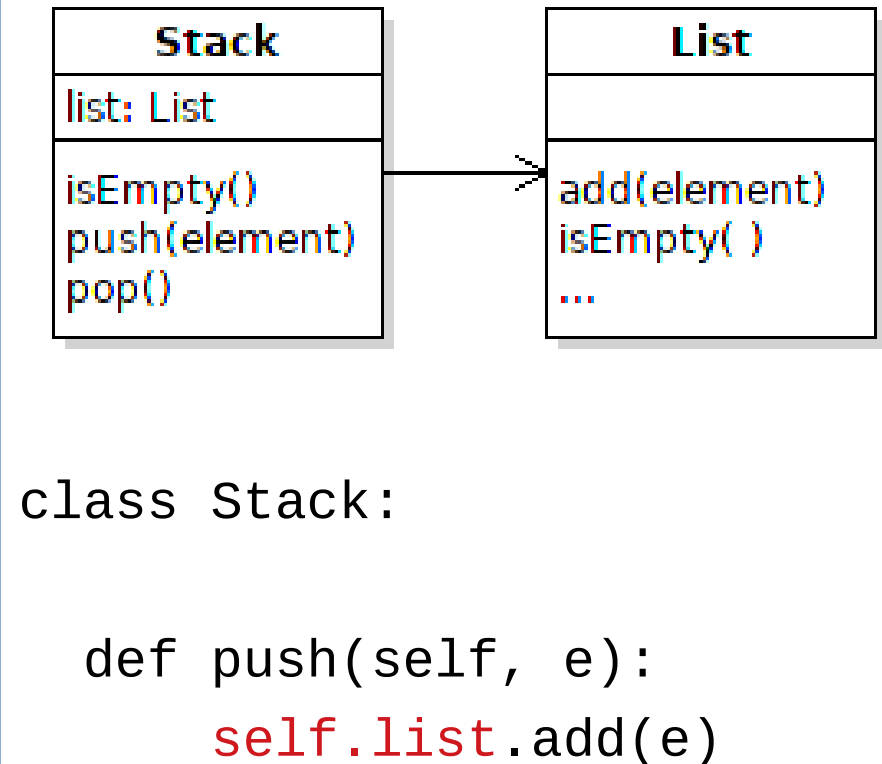

Why not move `add(element)` to **Collection**, too? 10

# Replace Inheritance with Delegation

## BEFORE

## AFTER

**After:** Stack must implement `isEmpty()`, too.

# Why Not Stack extends List?

## O-O Basics:

- Stack *is not* a List. Fails the "*is a*" test.

## Design Principle:

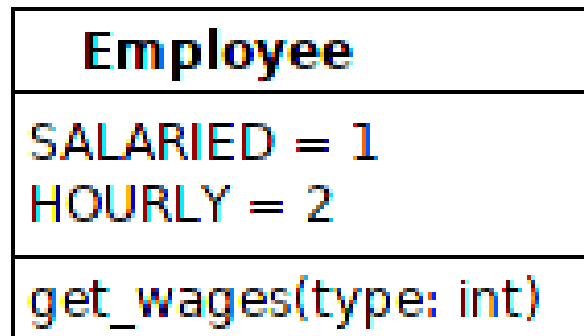

- Prefer Composition over Inheritance, *also called*
- Prefer Delegation over Inheritance

## Code Symptom:

- *Refused Bequest* - Stack doesn't use the List methods

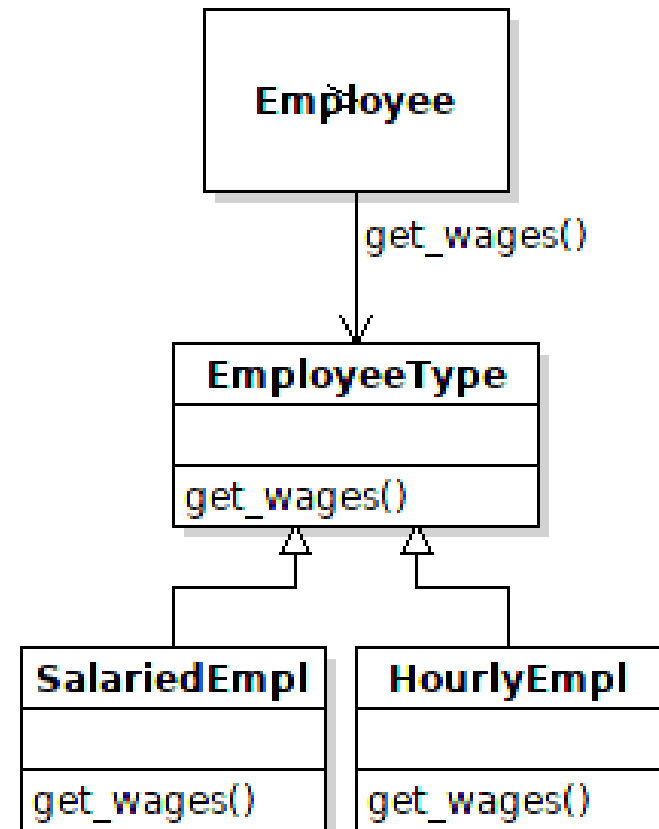

# (two names for this refactoring)

## BEFORE

```
def get_wages(self, type):
    if type == SALARIED:
        ...
    elif type == HOURLY:
        ...
```

## AFTER

?

## BEFORE

```
bird = 0
cat = 1
dog = 2
def speak(species):
    if species == bird:
        print("chirp, chirp")
    elif species == cat:
        print("meow")
    elif species == dog:
        print("woof, woof")
    else: ...
```

## AFTER

```
species = Zoo.get("cat")

species.speak()

class Cat(Animal):
    def speak(self):
        print("meow")

class Dog(Animal):
    def speak(self):
        print("woof, woof")
```

# Why Refactor?

---

For each refactoring, state the benefit(s) of it.

Be specific.

Avoid vague claims like "*easier to ...*". Instead, state why and how something is "*easier*".

# *Extract Method*

---

## Benefits:

- increase opportunity to reuse code and eliminate duplicate code
- make method easier to understand, which reduces errors and improves maintainability
- by reducing the amount of work a method is doing, it gets closer to the goal of "1 method does only 1 thing", and make make for more descriptive method name
